Examples Of Putting It All Together

Example #1:

Concept: Nutella Ad (from the templates)

Angle(s):
Confidence Angle
*Sub avatar: **Desire** - wants their dog to stop pulling, **Product Experience** - has tried traditional harnesses, **Emotion** - feels embarrassed walking their dog, **Behavior** - Avoids walking their dog in certain situations*

Control Angle
*Sub avatar: **Desire** - wants their dog to stop pulling, **Product Experience** - has tried traditional harnesses, and it did not stop the dog from pulling, **Emotion** - feels frustrated that harnesses don't work*

Variations:
This is a harness | This is confidence
This is pulling | This is control

Format: Static graphic/design:

Testing Method: Marksman Method

Explanation:
In the ads above, we're actually testing two different Sub avatars here, aka angles. One of them is talking about the confidence angle, about having confidence while you walk your dog. The other is talking about the control angle and referencing traditional harnesses as something that

encourages your dog to pull. So again, here we are testing 2 different angles with 1 variation each.

📷 Origins - Example #2

Concept: Shift Worker Experience

Concept Explanation:
We're now optimizing individual ads for the Night Shift worker sub-avatar.

Angle:
Sleep better during the day with total darkness
Sub avatar: *Night shift worker*

Variations:
Graveyard shift! I'm finding it impossible to sleep in the morning
Night shift is killing me
Night shift job but I can't sleep all day. My life is taking a quick downturn...

Format: Subtitles B-Roll

Testing Method: Sniper Method

Explanation:
This is an example of getting a direction from a Marksman method test and then optimizing the rest of the hold and the ad for a specific sub-avatar to make it more relatable (although if you ask me, we didn't do it that well).

Example 1,2 Deep Dive: (Marksman Method + Sniper Method):

For images, it's very easy to test the Marksman method.

You have your 3 different angles and you test them congruently in your ad, and that's it.

With image ads, you should always be testing the Marksman Method unless you really have hit a true winner that you want to optimize further.

BUT, as much as images are simple and easy to test, most people SUCK at execution and can get "turned off from an angle" because they screwed up the execution part.

So, just because they **seem** simple to make does NOT mean they're EASY.

Now, the question is

"How does the Marksman Method work with videos?"

For those of you who know, whenever we test the 3:2:2 method, the "3" stands for 3 variations of the HOOK, and potentially the bridge, but mainly just the first 3-10 seconds.

Then the HOLD, everything else after the first 3-10 seconds, is where we keep things the same.

"But if you're taking bigger swings and testing multiple angles, how do you connect all of those to the same hold?"

Great question

As long as the HOLD is universal enough to support all the angles your hooks set up… You can run the Marksman Method on videos, too.

Put in terms of this avatar training:

As long as your hold is relevant to the CORE AVATAR that you are targeting, then you are fine.

When you're testing the Marksman method with video, focus on making the hooks MORE specific and the holds more generic.

Example From Above:

- Hook 1: "POV: You work night shift"
- Hook 2: "POV: You're a light sleeper"
- Hook 3: "POV: You have insomnia"

- Hold: Shows blinds closing → complete darkness → peaceful sleep

This works because the Hold just demonstrates the mechanism (total blackout) that resonates with the core avatar and helps the specific sub avatar understand why we called them out in the original hook.

Each hook, though, calls out WHO needs it.

The hold then just shows WHY they need it in a very simple way.

For most initial video concepts using the Marksman method, the hold does NOT need to be ultra specific to any of the hooks (at least not yet).

Now, if you make the hold more aligned with the hook, will it perform better?

100%

But again, the goal of the Marksman's method is to get direction.

If we can get direction on what hook is grabbing people's attention, then we can optimize the rest of the video using the Sniper Method

IMPORTANT NOTE:

If your hold is TOO specific to one angle's context, for example:

- Hold: Shows someone coming home from work at 7 am, the sun rising, kids getting ready for school, and THEN someone closing blinds to get darkness and go to bed.

That hold will likely NOT work for “POV: you’re a light sleeper” hook or "POV: You have insomnia" hook

It just doesn’t really make sense.

The hold really only works for: "POV: You work night shift" hook.

The Marksman Method with video works when:

- Hooks = Call out the specific sub avatar/angle
- Hold = Demonstrates the shared desire of the core avatar, or broader angle.

Once you understand what direction Meta is favoring, then you optimize the rest of the video, **the hold,** deeper with the sniper method to amplify the behaviors, experiences, emotions, etc. for that sub avatar/angle all the way through.

Again, the Marksman method is great for **finding direction FAST** (which angle resonates). But it lacks depth.

So, once you identify a direction, you need to use the **Sniper Method** to create more tailored videos that go DEEP on that angle.

In that instance, the 3 variations will be different executions of the angle.

I want to pause here because an even more important note is this…

At the end of the day, your customers don't give <u>2 SHITS</u> if you're running “Marksman Method” or “Sniper Methods”

They care about what’s in it for them.

So if you're confused about these two methods.

Just stick to this:

Marksman Method = Image Ads

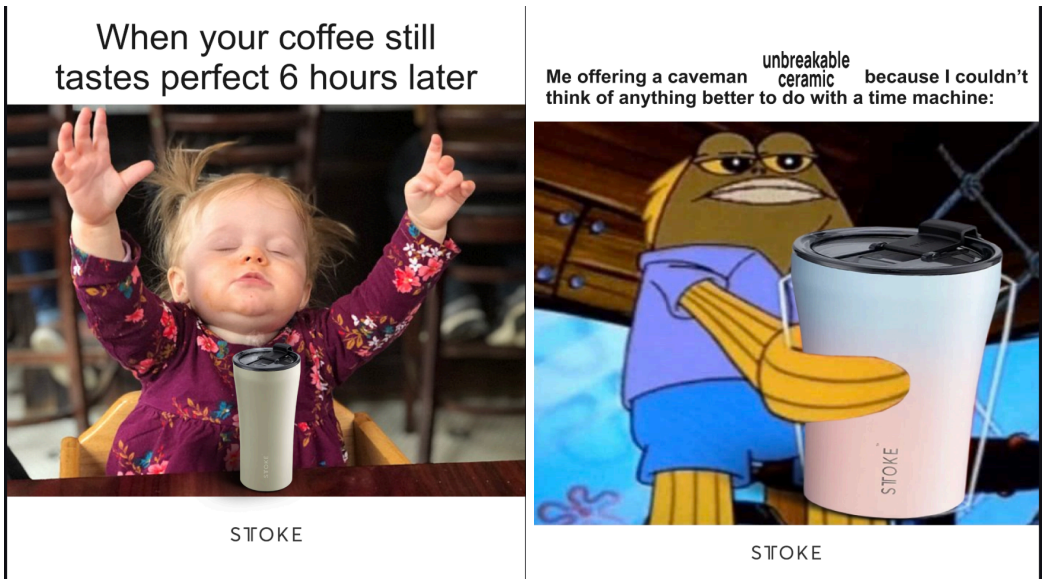
Sniper Method = Video Ads

Make the best ad you can for every angle/sub avatar.

Just make sure you're testing customer-first ads. And again, complete feedback loops so you know what you need to go deeper on.

Back to the Examples

Example #3:



Concept: Meme Static Ads

Angle(s):
Keeps your coffee hot for 6 hours
Unbreakable ceramic

Variations:
When your coffee still taste perfect 6 hours later
Me offering a caveman unbreakable ceramic….

Format: Meme Style

Testing Method: Marksman Method

Explanation:

Again, with this ad here, as you can see, we have a concept to do meme static ads, but meme static ads about what? In this instance, we decided to go after an angle around how it keeps your coffee hot for six hours, as well as an angle around how the ceramic cup is unbreakable.

Now, could these have been done a lot better and been MORE relatable if we actually went deeper on the sub-avatar?

YES. And unfortunately, our team didn't for this.

But, I wanted to include this one to help you understand that, again, even if our concept is to do meme static ads, we have an emphasis on what the meme static ads will be about.

Example 4:

📷 Ad Example #5

Concept: Career Ending Injury

Angle(s): Stay protected from a Career-Ending Injury

Variations:
Don’t risk a career-ending injury
This is the best way to prevent career-ending injuries
The right skate cut protection not only prevents career-ending injuries… but it can also save your life

Format: Subtitle Broll

Testing Method: Sniper Method

Explanation:
This is an example of an older style iteration that we had previously done.

And the only recommendation that I would have here is that these variations are much tighter. Meaning the hooks all say the same thing very similarly.

Whereas, as you'll see in example number six below, we still would recommend taking bigger swings when possible, even if it is different executions of the same angle.
